

Assignment Title	Mobile App Implementation & Final Evaluation
Learning outcomes covered	LO4: LO5: LO6:
Assignment Mode	Take Home Assignment
Maximum Marks	100
Contribution to the Final Grade	20%
Date published	28.09.2026
Deadline for submissions	09.10.2026
Mode of Submission	Online

Assignment description

Aim:

Implement a working mobile application based on the high-fidelity prototype developed in Milestone 02, using a justifiable technology stack, and validate it through user testing.

1.1 Objectives:

- Review the high-fidelity prototype and its traceability to the user requirements established in Milestone 01.
- Select a mobile technology stack (e.g., frontend framework, backend/API, database, authentication) and justify each choice against the project's requirements and constraints.
- Implement the mobile app, covering each member's assigned workload of interfaces from Milestone 01.
- Ensure the implemented interfaces match the high-fidelity prototype in structure and intent, documenting and justifying any necessary deviations.
- Design and execute functional test cases covering the core features and CRUD operations of the app.
- Design and conduct usability testing on the working app with a representative sample of real or proxy users.
- Analyse the testing results, document defects/usability issues found, and record fixes or planned improvements.
- Compile a single consolidated report covering Milestones 01, 02, and 03.

1.2 Things to Concern:

- The app must be a working, installable/runnable mobile application – not a clickable prototype.
- Each member must implement the interfaces from their own workload, with at least 2 working CRUD operations per interface (consistent with Milestone 01's project requirement).
- Any deviation between the implemented app and the high-fidelity prototype must be explicitly documented and justified in the report.
- Functional test cases must cover all core features; a traceability matrix linking test cases to user requirements is required.
- A minimum of 5 participants (real or proxy users) must take part in usability testing of the working app.
- Source code must be submitted via a version-controlled repository (e.g., GitHub) with a clear README containing setup and run instructions.
- Plagiarism is not tolerated; zero marks will be allocated if the examiner discovers that the work presented, including source code, is not the group's own.

1.3 Special Requirements:

Continue working in the same group of 4 members. The technology stack is open to the group's choice but must be justified in the report; the coordinator may request a change if the choice is not feasible within the project timeframe.

1.4 Deliverables:

- A single consolidated group report covering all three milestones (see template in Section 6.10).
- Complete, working source code (repository link) with instructions on how to build/run the app, plus an installable build (e.g., APK) where applicable.
- A live demonstration/viva where each member must individually demonstrate and explain the interfaces they implemented, the tech stack decisions, and the testing results.

1.5 Report Template:

- Maximum 35 pages including the cover page (consolidated across all milestones).
- PDF file name: IT3060HCI2026_Milestone03_Group<group number>
- Cover page content: IT3060 Human Computer Interaction, Milestones 01-03 (Final Report), Project title, Group number, Group name, Group member details.
- Required group member details: student ID, name, workload distribution.
- Body of the report:
 - Executive summary of the overall project
 - Milestone 01 summary – problem, stakeholders, user research, and elucidated requirements
 - Milestone 02 summary – sketches, wireframes, low- and high-fidelity prototypes
 - Tech stack selection and justification
 - System/app architecture overview
 - Implementation details and screenshots of the working app
 - Traceability matrix (requirements → prototype → implementation → test cases)
 - Functional test cases and results
 - Usability testing plan, execution, and results
 - Issues identified and fixes/recommendations
 - Overall time schedule (Gantt chart)

- Conclusion and lessons learned
- References (Not counted into the page limit).
- Appendix – full test case logs, additional screenshots, session recordings/links, source code excerpts, etc. (Not counted into the page limit).

NOTE: Max page number excludes the appendix, which you can include diagrams/descriptions/raw data extracts, etc.

Marking Scheme

Component	Description	Marks
Tech Stack Selection & Justification	Appropriateness of chosen frontend/backend/database technologies for a mobile app, with clear justification against project needs	3
Implementation & Fidelity	Functional completeness of the implemented app, correctness of CRUD operations, and fidelity to the Milestone 02 high-fidelity prototype and Milestone 01 requirements	8
Testing (Functional & Usability)	Coverage and quality of functional test cases, execution of usability testing with real/proxy users, and evidence of issues found and addressed	5
Consolidated Report & Demonstration/Viva	Quality and coherence of the final report covering all milestones, and ability to demonstrate the working app and defend implementation decisions during the viva	4
Total		20

You can use AI tools, but you can't put things the same as you take from the AI. In the report, we are going to check the percentage of the AI. It needs to be less than 50%.
